## LANGUAGE IF IT IS ACCEPTED BY SOME LATTICE ORDERED FINITE AUTOMATON

## P.VIJAYA VANI, POKALA BHASKARUDU

#### Abstract

In this paper we present some interesting results relating Regular Sets Boolean Algebras and Generalized Boolean Algebras. It is trivial that power set of any set is a Boolean Algebra under set inclusion. Here we try to recognize a particular finer class of sets of $\Sigma^{*}$ and show that it is a Boolean Algebra. We consider the class of Regular sets $Ł$ over a fixed $\Sigma$ and define a relation " $\leq "$ on Ł by L1 $\leq$ L2 if L1 Í L2. Then ( $£, \leq$ ) is a partially ordered set. With the same order, the poset ( $\llcorner, \leq$ ) is a lattice in which L1 Ú L2 $=$ L1 È L2 and L1 Ù L2 $=$ L1 Ç L2 .

Keywords: Regular Sets, Generalized Boolean Algebras.

## Definition: A Non-Deterministic Finite Automaton

 ( NDFA) is a quintuple$\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right) \quad$ where
Q is a non-empty finite set called the set of states of M . $\sum$ is a finite set called the input alphabet of M .
$\delta: \mathrm{Q} \times \sum \rightarrow 2^{\mathrm{Q}}$ is a function called the transition function of M .
$\mathrm{q}_{0}$ is a fixed element of Q called the initial state of M
$F$ is a subset of Q called the set of final states of M . Members of F are called accepting states.

Definition: A Deterministic Finite Automaton (D F A ) is a quintuple $\mathrm{M}=\left(\mathrm{Q}, \sum, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ where
Q is a non-empty finite set called the set of states of M .
$\sum$ is a finite set called the input alphabet of M .
$\delta: \mathrm{Q} \times \Sigma \rightarrow \mathrm{Q}$ is a function called the transition function of M .
$\mathrm{q}_{0}$ is a fixed element of Q called the initial state of M
$F$ is a subset of $Q$ called the set of final states of M.,members of F are called accepting states.

Note: In a NDFA $\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ if $\mathrm{I} \delta(\mathrm{q}, \mathrm{a})$ । $=1$ for every
$(\mathrm{q}, \mathrm{a}) \in \mathrm{Q} \times \sum$, then M is called a deterministic finite automaton ( DFA ).

Definition: A Finite Automaton (FA) is either a NDFA or DFA. Formally a finite automaton (FA) consists of a finite set of states and a set of transitions from state to state that occur on input symbols chosen from an alphabet $\Sigma$. One state, usually denoted $\mathrm{q}_{0}$, is the initial state, in which the automaton starts. Some states are designated as final or accepting states.
A Finite Automaton (FA ) may be interpreted as a finite control which is in some state of Q , reading a sequence of symbols from $\sum$ written on a tape. In one move the Finite Automaton in state ' $q$ ' and scanning symbol ' a ' enters next state $\quad \delta(\mathrm{q}, \mathrm{a})$ and moves its head one symbol to the right.

Figure-2.1.12

Definition: A directed graph called a Transition diagram is associated with an FA as follows. The vertices of the graph correspond to the states of the FA. If there is a transition from state q to state p on input a then there is an arc labeled a from state q to state p in the transition diagram. The FA accepts a string x if the sequence of transitions corresponding to the symbols of x leads from the start state to an accepting state. Accepting states are double circled.

## Example of Automaton transition:

For $\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ where
$\mathrm{Q}=\left\{\mathrm{q}_{0}, \mathrm{q}_{1}, \mathrm{q}_{2}, \mathrm{q}_{3}, \mathrm{q}_{4}\right\}$;
$\Sigma=\{0,1\}$;
$\mathrm{q}_{0}$ is the start state;
$\mathrm{F}=\left\{\mathrm{q}_{2}, \mathrm{q}_{4}\right\}$

| $\delta$ as follows |  |  |
| :--- | :---: | :---: |
| $\delta$ | 0 | 1 |
| $\mathrm{q}_{0}$ | $\left\{\mathrm{q}_{0}, \mathrm{q}_{3}\right\}$ | $\left\{\mathrm{q}_{0}, \mathrm{q}_{1}\right\}$ |
| $\mathrm{q}_{1}$ | $\emptyset$ | $\left\{\mathrm{q}_{2}\right\}$ |
| $\mathrm{q}_{2}$ | $\left\{\mathrm{q}_{2}\right\}$ | $\left\{\mathrm{q}_{2}\right\}$ |
| $\mathrm{q}_{3}$ | $\left\{\mathrm{q}_{4}\right\}$ | $\emptyset$ |
| $\mathrm{q}_{4}$ | $\left\{\mathrm{q}_{4}\right\}$ | $\left\{\mathrm{q}_{4}\right\}$ |

Figure- 2.1.14
Definition: A Finite Automaton (FA ) accepts a string ' $s$, if the sequence of transitions corresponding to the symbols of ' $s$ ' starting from the initial state and ends at an accepting state.

Definition: A string ' $s$ ' is said to be accepted by a Finite Automaton $\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ if $\delta(\mathrm{q}, \mathrm{s})$ contains an element of F .

Definition: Extend $\delta$ to $\delta^{*}$ from $\mathrm{Q} \times \Sigma^{*} \rightarrow 2^{\mathrm{Q}}$, defined as

1. $\delta^{*}(\mathrm{q}, \mathrm{sa})=\delta\left(\delta^{*}(\mathrm{q}, \mathrm{s})\right.$, a $)$ for all strings s and input symbols a.
2. $\delta^{*}(\mathrm{q}, \varepsilon)=\mathrm{q}$.

Definition: The language accepted by a Finite Automaton $\mathrm{M}=\left(\mathrm{Q}, \sum, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ denoted by $\mathrm{L}(\mathrm{M})$ is the set
$\mathrm{L}(\mathrm{M})=\left\{\mathrm{s} / \delta^{*}\left(\mathrm{q}_{0}, \mathrm{~s}\right)\right.$ contains an element of F$\}$
Definition: A language $L$ is said to be a regular set if it is the set accepted by some Finite Automaton.

Theorem: [Theorem 2.1 of [1]] Let $L$ be a set accepted by a Non-Deterministic Finite Automaton. Then there exists a Deterministic Finite Automaton that accepts L
Proof: Let $\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ be a N D F A
accepting L.
Define a DFA, $\mathrm{M}^{1}=\left(\mathrm{Q}^{1}, \sum, \delta^{1}, \mathrm{q}_{0}{ }^{1}, \mathrm{~F}\right)$ as follows:
$\mathrm{F}^{1}=\{\mathrm{A} \subseteq \mathrm{Q} / \mathrm{A} \cap \mathrm{F} \neq \varnothing\}$
An element of $Q^{1}$ will be denoted by $\left[q_{1}, q_{2}, \ldots \ldots, q_{i}\right]$, where $\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots \ldots \ldots, \mathrm{q}_{\mathrm{i}}$ are in Q .
Let $\mathrm{q}_{0}{ }^{1}=\left[\mathrm{q}_{0}\right]$.
We define
$\delta^{1}\left(\left[q_{1}, q_{2}, \ldots \ldots ., q_{i}\right], a\right)=\left[p_{1}, p_{2}, \ldots \ldots \ldots, p_{j}\right]$
if and only if
$\delta\left(\left\{q_{1}, q_{2}, \ldots \ldots ., q_{i}\right\}, a\right)=\left\{p_{1}, p_{2}, \ldots \ldots \ldots, p_{j}\right\}$
that is $\delta^{1}$ is applied to an element
$\left[q_{1}, q_{2}, \ldots \ldots \ldots, q_{i}\right.$ ], of $Q^{1}$ is computed by applying $\delta$ to each state of $Q$ represented by $\quad\left[q_{1}, q_{2}, \ldots \ldots \ldots, q_{i}\right]$. On applying $\delta$ to each $\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots \ldots \ldots, \mathrm{q}_{\mathrm{i}}$ and taking the union, we get some new set of states, $p_{1}, p_{2}, \ldots \ldots \ldots ., p_{j}$. This new set has a representative $\left[p_{1}, p_{2}, \ldots \ldots \ldots ., p_{j}\right]$ in $\mathrm{Q}^{1}$, and that element is the value of $\delta^{1}\left(\left[\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots, \mathrm{q}_{\mathrm{i}}\right]\right.$, a $)$ It is easy to show by induction on the length of the input string ' s ' that $\delta^{1}\left(\mathrm{q}_{0}{ }^{1}, \mathrm{~s}\right)=\left[\mathrm{q}_{1}, \mathrm{q}_{2}, ., \mathrm{q}_{\mathrm{i}}\right]$ if and only if $\delta\left(q_{0}, s\right)=\left\{q_{1}, q_{2}, ., q_{i}\right\}$
Basis: The result is trivial for $|s|=0$, since $q_{0}{ }^{1}=\left[q_{0}\right]$ and $s$ must be $\varepsilon$.
Induction : Suppose that the hypothesis is true for inputs of length $m$ or less.
Let sa be a string of length $\mathrm{m}+1$ with a in $\sum$ then
$\delta^{1}\left(q_{0}{ }^{1}, \mathrm{sa}\right)=\delta^{1}\left(\delta^{1}\left(\mathrm{q}_{0}{ }^{1}, \mathrm{~s}\right), \mathrm{a}\right)$
By the inductive hypothesis
$\delta^{1}\left(q_{0}{ }^{1}, \mathrm{~s}\right)=\left[\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots \ldots \ldots, \mathrm{p}_{\mathrm{j}}\right]$
if and only if

$$
\delta\left(\mathrm{q}_{0}, \mathrm{~s}\right)=\left\{\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots \ldots \ldots ., \mathrm{p}_{\mathrm{j}}\right\}
$$

But by definition of $\delta^{1}$,
$\delta^{1}\left(\left[p_{1}, p_{2}, \ldots \ldots \ldots, p_{j}\right], a\right)=\left[r_{1}, r_{2}, \ldots \ldots, r_{k}\right]$ if and only if
$\delta\left(\left\{p_{1}, p_{2}, \ldots \ldots \ldots, p_{j}\right\}, a\right)=\left\{r_{1}, r_{2}, \ldots \ldots \ldots, r_{k}\right\}$, which establishes the inductive hypothesis. Now we have only to add that $\delta^{1}\left(\mathrm{q}_{0}{ }^{1}, \mathrm{~s}\right)$ is in F exactly when $\delta\left(\mathrm{q}_{0}, \mathrm{~s}\right)$ contains a state of Q that is in F .
Thus $L(M)=L\left(M^{1}\right)$
Since deterministic and nondeterministic finite automaton accept the same sets, we shall not distinguish between them unless it becomes necessary, but shall simply refer to both as finite automata.

Definition: A ND F A with $\varepsilon$ - transitions is a quintuple $\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ where
Q is a non-empty finite set of states
$\sum$ is a finite input alphabet
$\delta$ is a transition function $\mathrm{Q} \times \Sigma \cup\{\varepsilon\}$ to $2^{\mathrm{Q}}$ that is $\delta: \mathrm{Q} \times \sum \cup\{\varepsilon\} \rightarrow 2^{\mathrm{Q}}$
$\mathrm{q}_{0}$ is an initial state, $\mathrm{q}_{0} \in \mathrm{Q}$
$F$ is a subset of Q called the set of final states of $M$. Members of F are called accepting states.

Definition: Let $\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ be an N D F A. Let $\mathrm{q} \in \mathrm{Q}, \varepsilon$ - Closure $(\mathrm{q})$ is defined as the set of all vertices p such that there is a path from q to p labeled $\varepsilon$.

Definition: Let $\mathrm{M}=\left(\mathrm{Q}, \sum, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ be an N D F A. Let $\mathrm{P} \subseteq \mathrm{Q}$.
$\varepsilon$-closure $(\mathrm{P})$ is defined as $\underset{\mathrm{p} \text { in } \mathrm{P}}{\varepsilon \text { - Closure }(\mathrm{p}) \text {. Now we }}$ define $\delta^{\wedge}$ as follows. $\quad \mathrm{p}$ in P

1. $\hat{\delta}(\mathrm{q}, \varepsilon)=\varepsilon$ - Closure $(\mathrm{q})$.
2. For w in $\Sigma^{*}$ and a in $\Sigma, \hat{\delta}$ ( q, wa) $=\varepsilon$ - $\operatorname{Closure(P),~}$ where $\mathrm{P}=\{\mathrm{p} /$ for some r in $\hat{\delta}(\mathrm{q}, \mathrm{w}), \mathrm{p}$ is in $\delta(\mathrm{r}, \mathrm{a})\}$, It is convenient to extend $\delta$ and $\hat{\delta}$ two sets of states by $\delta(\mathrm{R}, \mathrm{a})=\cup_{\mathrm{q} \text { in } \mathrm{R}} \delta(\mathrm{q}, \mathrm{a})$ and
$\hat{\delta}(\mathrm{R}, \mathrm{w})=\cup_{\mathrm{q} \text { in } \mathrm{R}} \hat{\delta}(\mathrm{q}, \mathrm{w})$ for sets of states R
We define $\mathrm{L}(\mathrm{M})$, the language accepted by
$\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ to Be
$\left\{\mathrm{w} / \hat{\delta}\left(\mathrm{q}_{0}, \mathrm{w}\right)\right.$ contains a state in F$\}$.
2.2.5 Theorem: If L is accepted by an N D F A with $\varepsilon$ transitions then L is accepted by an N D F A without $\varepsilon-$ transitions.
Proof. Let $\mathrm{M}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ be an NDFA with $\varepsilon$ - transitions.
Construct $\mathrm{M}^{1}=\left(\mathrm{Q}, \sum, \delta^{1}, \mathrm{q}_{0}, \mathrm{~F}^{1}\right)$ where

$$
F^{\prime}=\left\{\begin{array}{l}
F_{1}=F \cup\left\{Q_{d i l} \text { if } x \text { - Closure(90) contains a state of } F\right. \\
F \text { otherwise }
\end{array}\right.
$$

and $\delta^{1}(\mathrm{q}, \mathrm{a})$ is $\hat{\delta}(\mathrm{q}, \mathrm{a})$ for q in Q and a in $\Sigma$. Note that $\mathrm{M}^{1}$ has no $\varepsilon$ - transitions. Thus we may use $\delta^{1}$ for $\delta^{1} \wedge$.
We show by induction on $|\mathrm{x}|$ that $\delta^{1}\left(\mathrm{q}_{0}, \mathrm{x}\right)=\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{x}\right)$.
However this statement may not be true for $\mathrm{x}=\varepsilon$,
since $\delta^{1}\left(\mathrm{q}_{0}, \varepsilon\right)=\left\{\mathrm{q}_{0}\right\}$, while $\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{x}\right)=\varepsilon$ - $\operatorname{closure}\left(\mathrm{q}_{0}\right)$. We therefore begin our induction at 1 .
Basis : $|\mathrm{x}|=1$. Then x is a symbol ' a ' and
$\delta^{1}\left(\mathrm{q}_{0}, \mathrm{a}\right)=\hat{\delta} \quad\left(\mathrm{q}_{0}\right.$, a) by definition of $\delta^{1}$.
Induction : $|\mathrm{x}|>1$. Let $\mathrm{x}=$ wa for symbol a in $\Sigma$.
Then $\delta^{1}\left(q_{0}\right.$, wa $)=\delta^{1}\left(\delta^{1}\left(q_{0}, w\right), a\right)$.
By the inductive hypothesis $\delta^{1}\left(\mathrm{q}_{0}, \mathrm{w}\right)=\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{w}\right)$.
Let $\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{x}\right)=\mathrm{P}$.
We must show that $\delta^{1}(\mathrm{P}, \mathrm{a})=\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{wa}\right)$.

But $\delta^{1}(\mathrm{P}, \mathrm{a})=\cup_{\mathrm{q} \text { in } \mathrm{P}} \delta^{1}(\mathrm{q}, \mathrm{a})=\cup_{\mathrm{q} \text { in } \mathrm{P}} \hat{\delta}(\mathrm{q}, \mathrm{a})$.
Then as
$\mathrm{P}=\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{w}\right)$ we have $\cup_{\mathrm{q} \text { in } \mathrm{P}} \hat{\delta}(\mathrm{q}, \mathrm{a})=\hat{\delta}\left(\mathrm{q}_{0}\right.$, wa $)$.
Thus $\delta^{1}\left(q_{0}\right.$, wa $)=\hat{\delta}\left(q_{0}\right.$, wa $)$.
For completeness we show that $\delta^{1}\left(q_{0}, x\right)$ contains a state of $\mathrm{F}^{1}$ if and only if $\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{x}\right)$ contains a state in F .
If $\mathrm{x}=\varepsilon$, this statement is immediate from the definition of $\mathrm{F}^{1}$. That is $\delta^{1}\left(\mathrm{q}_{0}, \varepsilon\right)=\left\{\mathrm{q}_{0}\right\}$, and $\mathrm{q}_{0}$ is placed in $\mathrm{F}^{1}$ whenever $\hat{\delta}\left(\mathrm{q}_{0}, \varepsilon\right)$ which is $\varepsilon$ - $\operatorname{Closure}\left(\mathrm{q}_{0}\right)$, contains a state possibly $\mathrm{q}_{0}$ in F . If $\mathrm{x} \neq \varepsilon$ then $\mathrm{x}=$ wa for some symbol a. If $\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{x}\right)$ contains a state in F , then surely $\delta^{1}$ $\left(q_{0}, x\right)$ contains a state in $F^{1}$. Conversely if $\delta^{1}\left(q_{0}, x\right)$ contains a state in $\mathrm{F}^{1}$ other than $\mathrm{q}_{0}$, then $\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{x}\right)$ contains a state in F. If $\delta^{1}\left(\mathrm{q}_{0}, \mathrm{x}\right)$ contains $\mathrm{q}_{0}$ and $\mathrm{q}_{0}$ is not in F , then as $\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{x}\right)=\varepsilon-\operatorname{Closure}\left(\delta\left(\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{w}\right)\right.\right.$, a) $)$, the state in $\varepsilon$ - Closure ( $\mathrm{q}_{0}$ ) and in F must be in $\hat{\delta}\left(\mathrm{q}_{0}, \mathrm{x}\right)$.
Thus L accepted by an N D F A with $\varepsilon$ - transitions is accepted by an NDFA without $\varepsilon$ - transitions.

Definition: Let $\sum$ be a finite set of symbols and let languages $\mathrm{L}, \mathrm{L}_{1}, \mathrm{~L}_{2}$ be sets of strings from $\sum^{*}$
$>$ The concatenation of $L_{1}$ and $L_{2}$, denoted by $L_{1} L_{2}$ is the set
$\mathrm{s}_{1} \mathrm{~s}_{2} / \mathrm{s}_{1}$ is in $\mathrm{L}_{1}$ and $\mathrm{s}_{2}$ is in $\left.\mathrm{L}_{2}\right\}$.
$\rightarrow$ The Kleene Closure of L , denoted by $\mathrm{L}^{*}$, is the set $L^{*}=\cup_{i}^{\infty}=0 L^{i}$
> The Positive Closure of L , denoted by $\mathrm{L}^{+}$, is the set $\mathrm{L}^{+}=\cup_{\mathrm{i}}^{\infty}{ }_{=0} \mathrm{~L}^{\mathrm{i}}$
$>\mathrm{L}^{*}=\mathrm{LL}^{\mathrm{i}-1}$ and $\mathrm{L}^{0}=\{\varepsilon\}$.
Definition : If $r$ is a regular expression of the language $L$ then we write $\mathrm{L}=\mathrm{L}(\mathrm{r})$. The regular expressions are said to be equal i.e., $r=s$ if $L(r)=L(s)$.

Definition: Let $\Sigma$ be an alphabet, the regular expressions over $\sum$ are defined recursively as follows.
$>\varnothing$ is a regular expression and denotes the empty set.
$>\varepsilon$ is a regular expression and denotes the set $\{\varepsilon\}$.
$>$ For each ' a ' in $\Sigma$, ' a ' is a regular expression and denotes the set $\{a\}$.
$>$ If $1_{1}$ and $1_{2}$ are regular expressions corresponding to the languages $L_{1}$ and $L_{2}$ respectively. Then $\left(l_{1}+l_{2}\right),\left(l_{1} l_{2}\right.$ ), $\mathrm{l}_{1}{ }^{*}$ and $\mathrm{l}_{2}{ }^{*}$ are regular expressions that corresponding to the sets $\mathrm{L}_{1} \cup \mathrm{~L}_{2}, \mathrm{~L}_{1} \mathrm{~L}_{2}, \mathrm{~L}_{1}{ }^{*}$ and $\mathrm{L}_{2}{ }^{*}$ respectively.

Definition : If $r$ is a regular expression denoting the language L then we write $\mathrm{L}=\mathrm{L}(\mathrm{r})$. We say that regular expression $r$ and $s$ are equal, and write $r=s$ if $L(r)=L(s)$.

Result: For regular expressions $\mathrm{r}, \mathrm{s}, \mathrm{t}$ corresponding to the languages $L(r), L(s), L(t)$ respectively. It is easy to verify the following.

- $\mathrm{r}+\mathrm{s}=\mathrm{s}+\mathrm{r}$
- $\quad(r+s)+t=r+(s+t)$
- ( rs$) \mathrm{t}=\mathrm{r}(\mathrm{st})$
- $r(s+t)=r s+r t$
- $(r+s) t=r t+s t$
- $\phi^{*}=\varepsilon$
- $\left(\mathrm{r}^{*}\right)^{*}=\mathrm{r}^{*}$
- $(\varepsilon+r)^{*}=r^{*}$
- $\left(\mathrm{r}^{*} \mathrm{~s}^{*}\right)^{*}=(\mathrm{r}+\mathrm{s})^{*}$

Theorem: Let $r$ be a regular expression of a language $L$. Then there exists an N D F A with $\varepsilon$ - transitions that accepts L (r).
Proof: We shall prove this theorem by induction on the number of operators in the regular expression ' $r$ 'of $L$, that there is an N D F A with $\varepsilon$ - transitions, having one final state and no transitions out of this final state, such that $\mathrm{L}(\mathrm{M})=\mathrm{L}(\mathrm{r})$.
Suppose the expression $r$ has zero operators.
Since r has zero operators, the expression r must be $\varepsilon, \phi$, or a for ' a' in $\sum$. The NDF A 's in the following figures clearly satisfy the conditions.

1. $\mathrm{r}=\varepsilon$

2. $r=\phi$

3. $\mathrm{r}=\mathbf{a}$

Assume that the theorem is true for regular expressions $r$ with fewer than $n$ operators, $n>1$. Let $r$ have $n$ operators. There are three cases depending on the form of $r$.
Case 1 : Let $r=r_{1}+r_{2}$, where $r_{1}$ and $r_{2}$ are regular expressions less than n operators. Thus there are N D F A
's $\mathrm{M}_{1}=\left(\mathrm{Q}_{1}, \Sigma_{1}, \delta, \mathrm{q}_{1},\left\{\mathrm{f}_{1}\right\}\right)$ and
$\mathrm{M}_{2}=\left(\mathrm{Q}_{2}, \sum_{2}, \delta, \mathrm{q}_{2},\left\{\mathrm{f}_{2}\right\}\right)$ with
$\mathrm{L}\left(\mathrm{M}_{1}\right)=\mathrm{L}\left(\mathrm{r}_{1}\right)$ and $\mathrm{L}\left(\mathrm{M}_{2}\right)=\mathrm{L}\left(\mathrm{r}_{2}\right)$.
Since we may rename states of a N D F A at will we may assume $\mathrm{Q}_{1}$ and $\mathrm{Q}_{2}$ are disjoint. Let $\mathrm{q}_{0}$ be a new initial state and $f_{0}$ a new final state.
We construct
$M=\left(Q_{1} \cup Q_{2} \cup\left\{q_{0}, f_{0}\right\}, \Sigma_{1} \cup \Sigma_{2}, \delta, q_{0},\left\{f_{0}\right\}\right)$,
Where $\delta$ is defined by
$1 . \delta\left(\mathrm{q}_{0}, \varepsilon\right)=\left\{\mathrm{q}_{1}, \mathrm{q}_{2}\right\}$.
2. $\delta(\mathrm{q}, \mathrm{a})=\delta_{1}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{1}-\left\{\mathrm{f}_{1}\right\}$ and a in $\sum_{1} \cup\{\varepsilon\}$
3. $\delta(\mathrm{q}, \mathrm{a})=\delta_{2}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{2}-\left\{\mathrm{f}_{2}\right\}$ and a in $\sum_{2} \cup\{\varepsilon\}$
4. $\delta\left(\mathrm{f}_{1}, \varepsilon\right)=\delta_{1}\left(\mathrm{f}_{2}, \varepsilon\right)=\left\{\mathrm{f}_{0}\right\}$

We recall by the inductive hypothesis that there are no transitions out of $f_{1}$ or $f_{2}$ in $M_{1}$ or $M_{2}$. Thus all the moves of $\mathrm{M}_{1}$ and $\mathrm{M}_{2}$ are present in M .
The construction of M is depicted in the following figure.

Figure 2.3.6
Thus any path in the transition diagram of $M$ from $q_{0}$ to $f_{0}$ must begin by going to either $\mathrm{q}_{1}$ or $\mathrm{q}_{2}$ or $\varepsilon$. If the path goes to $q_{1}$, it may follow any path in $M_{1}$ to $f_{1}$ and then go to $f_{0}$ on $\varepsilon$. Similarly paths that begin by going to $\mathrm{q}_{2}$ may follow any path in $M_{2}$ to $f_{2}$ and then go to $f_{0}$ on $\varepsilon$. These are the only paths from $q_{0}$ to $f_{0}$. It follows immediately that there is a path labeled ' s ' in $\mathrm{M}_{1}$ from $\mathrm{q}_{1}$ to $\mathrm{f}_{1}$ or a path in $M_{2}$ from $q_{2}$ to $f_{2}$.
Hence $L(M)=L\left(M_{1}\right) \cup L\left(M_{2}\right)$ as desired.
Case 2:r $=r_{1} r_{2}$
Let $\mathrm{M}_{1}$ and $\mathrm{M}_{2}$ be as in case 1 and construct
$\mathrm{M}=\left(\mathrm{Q}_{1} \cup \mathrm{Q}_{2}, \Sigma_{1} \cup \sum_{2}, \delta, \mathrm{q}_{1},\left\{\mathrm{f}_{2}\right\}\right)$, where
$1 . \delta(\mathrm{q}, \mathrm{a})=\delta_{1}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{1}-\left\{\mathrm{f}_{1}\right\}$ and a in $\sum_{1} \cup$
$\{\varepsilon\}$
2. $\delta\left(\mathrm{f}_{1}, \varepsilon\right)=\left\{\mathrm{q}_{2}\right\}$
3. $\delta(\mathrm{q}, \mathrm{a})=\delta_{2}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{2}$ and a in $\sum_{2} \cup\{\varepsilon\}$

The construction of M is given in the following figure.

Figure 2.3.6
Every path in M from $\mathrm{q}_{1}$ to $\mathrm{f}_{2}$ is a path labeled by some string ' $s$ ' from $q_{1}$ to $f_{1}$, followed by the edge from $f_{1}$ to $\mathrm{q}_{2}$ labeled $\varepsilon$,followed by a path labeled by some string from $q_{2}$ to $f_{2}$ Thus $L(M)=\left\{x y / x\right.$ is in $L\left(M_{1}\right)$ and $y$ is in $\left.L\left(M_{2}\right)\right\}$ and $L(M)=L\left(M_{1}\right) L\left(M_{2}\right)$ as desired.
Case 3:r $=r_{1}{ }^{*}$
Let $\mathrm{M}_{1}=\left(\mathrm{Q}_{1} \cup\left\{\mathrm{q}_{0}, \mathrm{f}_{0}\right\}, \Sigma_{1}, \delta, \mathrm{q}_{0},\left\{\mathrm{f}_{0}\right\}\right)$, Where $\delta$ is given by

1. $\delta\left(\mathrm{q}_{0}, \varepsilon\right)=\delta\left(\mathrm{f}_{1}, \varepsilon\right)=\left\{\mathrm{q}_{1}, \mathrm{f}_{0}\right\}$
2. $\delta(\mathrm{q}, \mathrm{a})=\delta_{1}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{1}-\{\mathrm{f}\}$ and a in $\Sigma_{1} \cup\{$ $\varepsilon$ \}.
The construction of M is depicted in the following figure.

Figure 2.3.6
So any path from $q_{0}$ to $f_{0}$ consists either of a path from $q_{0}$ to $\mathrm{f}_{0}$ on $\varepsilon$ or a path from $\mathrm{q}_{0}$ to $\mathrm{q}_{1}$ on $\varepsilon$, followed by some number (possibly zero) of paths from $\mathrm{q}_{1}$ to $\mathrm{f}_{1}$, then back to $\mathrm{q}_{1}$ on $\varepsilon$, each labeled by a string in $\mathrm{L}\left(\mathrm{M}_{1}\right)$, followed by a path from $q_{1}$ to $f_{1}$ on a string in $L\left(M_{1}\right)$, then to $f_{0}$ on
$\varepsilon$. Thus there is a path in $M$ from $q_{0}$ to $f_{0}$ labeled $x$ if and only if we can write $s=s_{1} s_{2} \ldots \ldots . s_{j}$ for some $\mathrm{j} \geq 0$ ( the case $\mathrm{j}=0$ means $\mathrm{s}=\varepsilon$ ) such that each $\mathrm{s}_{\mathrm{i}}$ is in $L\left(M_{1}\right)$
Hence $L(M)=L\left(M_{1}\right)^{*}$ as desired.
Theorem: If $L$ is accepted by a DFA then $L$ is denoted by a regular expression.
Proof: Let L be the language accepted by the DFA $\mathrm{M}=$ ( $\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{~F}$ ) where $Q=\left\{q_{1}, q_{2}, q_{3}\right.$
,$\left.\ldots \mathrm{q}_{\mathrm{n}}\right\}$. Let $\mathrm{R}_{\mathrm{ij}}{ }^{\mathrm{k}}$ denote the set of all strings x such that $\delta\left(q_{i}, x\right)=q_{j}$ and if $\quad \delta\left(q_{i}, y\right)=q_{1}$, for any $y$ that is a prefix of x other than x or $\varepsilon$, then $1 \leq \mathrm{k}$. That is $\mathrm{R}_{\mathrm{ij}}^{\mathrm{k}}$ is the set of all strings that take the finite automaton from state $q_{i}$ to state $q_{j}$ with out going through any state numbered higher than $k$. Since there is no state numbered greater than $n, R_{i j}^{k}$ denotes all strings that take $q_{i}$ to $q_{j}$. We can define $\mathrm{R}_{\mathrm{ij}}^{\mathrm{k}}$ recursively,
$R^{k}{ }_{i j}=R^{k-1}{ }_{i k}\left(R^{k-1}{ }_{k k}\right) * R^{k-1}{ }_{k j} \cup R^{k-1}{ }_{i j}$
$\mathrm{R}_{\mathrm{ij}}^{0}=\left\{\mathrm{a} /\left(\delta\left(\mathrm{q}_{\mathrm{i}}, \mathrm{a}\right)=\mathrm{q}_{\mathrm{j}}\right\} \quad\right.$ if $\mathrm{i} \neq \mathrm{j}$
$=\left\{a /\left(\delta\left(q_{i}, a\right)=q_{j}\right\} \cup\{\varepsilon\}\right.$ if $i=j$
We show that for each $\mathrm{i}, \mathrm{j}, \mathrm{k}$ there exists a regular expression $\mathrm{r}^{\mathrm{k}}{ }_{\mathrm{ij}}$ denoting the language $\mathrm{R}_{\mathrm{ij}}^{\mathrm{k}}$. We proceed by induction on k .
Basis: $\mathrm{k}=0 . \mathrm{R}_{\mathrm{ij}}^{0}$ is a finite set of strings each of which either $\varepsilon$ or a single symbol. Thus $\quad \mathrm{r}^{0}{ }_{\mathrm{ij}}$ can be written as $a_{1}+a_{2}+a_{3}+\ldots+a_{p}$ or $\left(a_{1}+a_{2}+a_{3}+\ldots+a_{p}+\varepsilon\right)$ if $i=$ $j$, where $\quad\left\{a_{1}, a_{2}, a_{3}, \ldots a_{p}\right\}$ is the set of all symbols a such that $\delta\left(q_{i}, a\right)=q_{j}$.
If there are no such a's then $\varnothing(\varepsilon$ or in the case $i=j)$ serves as $\mathrm{r}_{\mathrm{ij} \text {. }}^{0}$
Induction: The recursive formula for $\mathrm{R}^{\mathrm{k}}{ }_{\mathrm{ij}}$ given clearly involves only the regular expression operators: union, concatenation and closure. By the induction hypothesis for each 1 and m there exists a regular expression $\mathrm{r}^{\mathrm{k}-1}{ }_{\mathrm{lm}}$ such that $L\left(r^{k-1}{ }_{l m}\right)=R^{\mathrm{k}-1}{ }_{\mathrm{lm}}$. Thus for $\mathrm{r}^{\mathrm{k}}{ }_{\mathrm{ij}}$ we may select the regular expression
$\mathrm{r}_{\mathrm{ij}}^{\mathrm{k}}=\left(\mathrm{r}^{\mathrm{k}-1}{ }_{\mathrm{ik}}\right)\left(\mathrm{r}^{\mathrm{k}-1}{ }_{\mathrm{kk}}\right) *\left(\mathrm{r}^{\mathrm{k}-1}{ }_{\mathrm{kj}}\right)+\left(\mathrm{r}^{\mathrm{k}-1}{ }_{\mathrm{ij}}\right)$, which completes the induction.
Now we observe that $L(M)=\cup_{q \text { in } F} R^{n}{ }_{1 j}$ since $R^{n}{ }_{1 j}$ denotes the labels of all paths from $q_{1}$ to $q_{j}$. Thus $L(M)$ is denoted by the regular expression.
$r^{n}{ }_{1 j 1}+r^{n}{ }_{1 j 2}+r^{n}{ }_{1 j 3}+\ldots \ldots . .+r^{n}{ }_{1 j p}$. where $F=\left\{q_{j 1}+q_{j 2}+q_{j 3}\right.$ $\left.+\ldots \ldots .+q_{1 \mathrm{jp}}\right\}$.
Thus L accepted by a DFA is denoted by a regular expression.

Figure 2.3.7
Thus the languages accepted by finite automata are precisely the languages denoted by regular expressions are precisely the languages denoted by regular expressions. This equivalence was the motivation for calling finite automaton languages regular languages.

Pumping Lemma is a powerful tool for proving that certain languages are non regular.

Lemma:[Lemma 3.1 of [1]] Let $L$ be a regular language. Then there is a constant n such that if z is any word in L and $|\mathrm{z}| \geq \mathrm{n}$, we write $\mathrm{z}=\mathrm{uvw}$ in such a way that $|\mathrm{uv}| \leq \mathrm{n}$ , $|v| \geq 1$, and for all $i \geq 0, u v^{i} w$ is in L. Furthermore, $n$ is no greater than the number of states of the smallest FA accepting L.

Example: The language $L=\left\{\mathrm{a}^{\mathrm{j} 2} / \mathrm{j}\right.$ is an integer, $\left.\mathrm{j} \geq 1\right\}$, which consists of all strings of $a$ 's whose length is a perfect square, is not regular.
Solution: Assume L is a regular language and let m be the integer in the pumping lemma,
let $\mathrm{z}=\mathrm{a}^{\mathrm{m}}$. By the pumping lemma, $\mathrm{a}^{\mathrm{m}}$ may be written as uvw, where $1 \leq|\mathrm{v}| \leq \mathrm{m}$
and $u v^{j} w$ is in $L$ for all j . In particular, let $\mathrm{j}=2$.
However, $\mathrm{m}^{2}<\left|\mathrm{uv}^{2} \mathrm{w}\right| \leq \mathrm{m}^{2}+\mathrm{m}<(\mathrm{m}+1)^{2}$.
That is, the length of $u v^{2} w$ lies properly between $m^{2}$ and $(\mathrm{m}+1)^{2}$ and is thus not a perfect square.
Thus $u v^{2} w$ is not in $L$, a contradiction.
We conclude that L is not regular.
Theorem: The regular languages are closed under union, concatenation and kleene closure.
Proof: Claim 1 : Union of Regular languages is regular.
Let $L_{1}$ be $L\left(M_{1}\right)$ for DFA $M_{1}=\left(\mathrm{Q}_{1}, \sum_{1}, \delta, \mathrm{q}_{1},\left\{\mathrm{f}_{1}\right\}\right)$ and
Let $L_{2}$ be $L\left(M_{2}\right)$ for DFA $M_{2}=\left(\mathrm{Q}_{2}, \Sigma_{2}, \delta, \mathrm{q}_{2},\left\{\mathrm{f}_{2}\right\}\right)$.
If $r_{1}$ and $r_{2}$ are regular expressions denoting regular languages $L_{1}$ and $L_{2}$ then $r_{1}+r_{2}$ denotes $L_{1} \cup L_{2}=L(M)$ for DFA
$\mathrm{M}=\left(\mathrm{Q}_{1} \cup \mathrm{Q}_{2} \cup\left\{\mathrm{q}_{0}, \mathrm{f}_{0}\right\}, \Sigma_{1} \cup \sum_{2}, \delta, \mathrm{q}_{0},\left\{\mathrm{f}_{0}\right\}\right)$, where $\delta$ is

1. $\delta\left(\mathrm{q}_{0}, \varepsilon\right)=\left\{\mathrm{q}_{1}, \mathrm{q}_{2}\right\}$.
2. $\delta(\mathrm{q}, \mathrm{a})=\delta_{1}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{1}-\left\{\mathrm{f}_{1}\right\}$ and a in $\sum$ ${ }_{1} \cup\{\varepsilon\}$
3. $\delta(\mathrm{q}, \mathrm{a})=\delta_{2}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{2}-\left\{\mathrm{f}_{2}\right\}$ and a in $\Sigma$ ${ }_{2} \cup\{\varepsilon\}$
4. $\delta\left(\mathrm{f}_{1}, \varepsilon\right)=\delta_{1}\left(\mathrm{f}_{2}, \varepsilon\right)=\left\{\mathrm{f}_{0}\right\}$

So $L_{1} \cup L_{2}$ is also regular. Thus Union of Regular languages is regular.
Hence regular languages are closed under union.
Claim 2 : Concatenation of Regular languages is regular.
Let $L_{1}$ be $L\left(M_{1}\right)$ for DFA $M_{1}=\left(\mathrm{Q}_{1}, \Sigma_{1}, \delta, \mathrm{q}_{1},\left\{\mathrm{f}_{1}\right\}\right)$ and
Let $L_{2}$ be $L\left(M_{2}\right)$ for DFA $M_{2}=\left(Q_{2}, \Sigma_{2}, \delta, q_{2},\left\{f_{2}\right\}\right)$.
If $\mathrm{r}_{1}$ and $\mathrm{r}_{2}$ are regular expressions denoting regular languages $L_{1}$ and $L_{2}$ then $r_{1} r_{2}$ denotes $L_{1} L_{2}=L(M)$ for DFA
$\mathrm{M}=\left(\mathrm{Q}_{1} \cup \mathrm{Q}_{2}, \Sigma_{1} \cup \sum_{2}, \delta, \mathrm{q}_{1},\left\{\mathrm{f}_{2}\right\}\right)$, where $\delta$ is

1. $\delta(\mathrm{q}, \mathrm{a})=\delta_{1}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{1}-\left\{\mathrm{f}_{1}\right\}$
and $a$ in $\sum_{1} \cup\{\varepsilon\}$
2. $\delta\left(\mathrm{f}_{1}, \varepsilon\right)=\left\{\mathrm{q}_{2}\right\}$
3. $\delta(\mathrm{q}, \mathrm{a})=\delta_{2}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{2}$ and a in $\sum_{2} \cup\{\varepsilon\}$

So $L_{1} L_{2}$ is also regular. Thus Concatenation of Regular languages is regular.
Hence regular languages are closed under Concatenation.

Claim 3 : Kleene Closure of Regular languages is regular.
Let $\mathrm{L}_{1}$ be $\mathrm{L}\left(\mathrm{M}_{1}\right)$ for DFA $\mathrm{M}_{1}=\left(\mathrm{Q}_{1}, \Sigma_{1}, \delta, \mathrm{q}_{1},\left\{\mathrm{f}_{1}\right\}\right)$
If $r_{1}$ is a regular expression denoting regular language $L_{1}$ then $\mathrm{r}_{1}{ }^{*}$ denotes $\mathrm{L}_{1}{ }^{*}=\mathrm{L}=\mathrm{L}(\mathrm{M})$ for DFA
$\mathrm{M}=\left(\mathrm{Q}_{1} \cup\left\{\mathrm{q}_{0}, \mathrm{f}_{0}\right\}, \Sigma_{1}, \delta, \mathrm{q}_{0},\left\{\mathrm{f}_{0}\right\}\right)$
Where $\delta$ is given by

1. $\delta\left(\mathrm{q}_{0}, \varepsilon\right)=\delta\left(\mathrm{f}_{1}, \varepsilon\right)=\left\{\mathrm{q}_{1}, \mathrm{f}_{0}\right\}$
2. $\delta(\mathrm{q}, \mathrm{a})=\delta_{1}(\mathrm{q}, \mathrm{a})$ for q in $\mathrm{Q}_{1}-\{\mathrm{f}\}$ and a in $\sum_{1} \cup\{\varepsilon\}$.
So $\mathrm{L}=\mathrm{L}_{1}{ }^{*}$ is also regular. Thus Kleene Closure of Regular languages is regular.
Hence regular languages are closed under Kleene Closure.
Theorem: The class of regular languages is closed under complementation that is if L is a regular language and L $\subseteq \Sigma^{*}$ then $\sum^{*}-\mathrm{L}$ is a regular language.
Proof: Let L be L (M) for DFA $\mathrm{M}=\left(\mathrm{Q}, \Sigma_{1}, \delta, \mathrm{q}_{0}, \mathrm{~F}\right)$ and let $\mathrm{L} \subseteq \sum^{*}$ To prove the class of regular languages is closed under complementation, we construct a DFA $\mathrm{M}^{1}=\left(\mathrm{Q}, \Sigma, \delta, \mathrm{q}_{0}, \mathrm{Q}-\mathrm{F}\right)$.
First we may assume $\Sigma_{1}=\Sigma$, for if there are symbols in $\Sigma_{1}$ not in $\Sigma$, we may delete all transitions of M on symbols not in $\sum$. The fact that $\mathrm{L} \subseteq \sum^{*}$ assures us that we shall not there by change the language of M .
If there are symbols in $\sum$ not in $\sum_{1}$, then none of these symbols appear in words of L. We may therefore introduce a " dead state " 'd' into M with $\delta(\mathrm{d}, \mathrm{a})=\mathrm{d}$ for all a in $\sum$ and $\delta(\mathrm{q}, \mathrm{a})=\mathrm{d}$ for all q in Q and a in $\Sigma-\sum_{1}$. Now to accept $\sum^{*}-\mathrm{L}$, we complement the final state of M that is $\mathrm{M}^{1}=\left(\mathrm{Q}, \sum, \delta, \mathrm{q}_{0}, \mathrm{Q}-\mathrm{F}\right)$ then $\mathrm{M}^{1}$ accepts a word w if and only if $\delta\left(\mathrm{q}_{0}, \mathrm{w}\right)$ is in $\mathrm{Q}-\mathrm{F}$ that is w is in $\Sigma^{*}-\mathrm{L}$. Thus if L is a regular language and $\mathrm{L} \subseteq \Sigma^{*}$ then $\Sigma^{*}-\mathrm{L}$ is a regular language that is the class of regular languages is closed under complementation.

Theorem: The class of regular languages are closed under intersection.
Proof: Let $L_{1}$ be $L\left(M_{1}\right)$ for DFA $M_{1}=\left(Q_{1}, \Sigma, \delta, \mathrm{q}_{1}, \mathrm{~F}_{1}\right)$ and
Let $L_{2}$ be $L\left(M_{2}\right)$ for DFA $M_{2}=\left(\mathrm{Q}_{2}, \Sigma, \delta, \mathrm{q}_{2}, \mathrm{~F}_{2}\right)$.
Consider $\mathrm{L}_{1} \cap \mathrm{~L}_{2}$
$\overline{\mathrm{L}_{1}} \cap \overline{\mathrm{~L}_{2}}=\mathrm{L}_{1} \cup \mathrm{~L}_{2}$,
where the over bar denotes the complementation with respect to an alphabet including the alphabets $L_{1}$ and $L_{2}$. Thus Closure under intersection follows from closure under union and complementation.

Definition Let $\mathbf{L}$ be the class of regular languages. Define a relation " $\leq$ " on $\mathbf{L}$ by $\mathrm{L}_{1} \leq \mathrm{L}_{2}$ if $\mathrm{L}_{1} \subseteq \mathrm{~L}_{2}$.

Proposition: If $\mathbf{L}$ be the class of regular languages then ( $\mathbf{L}, \leq$ ) is a partially ordered language.
Proof: For any $L_{1} \in \mathbf{L}$, we have by the definition of "is contained in "
$\mathrm{L}_{1} \subseteq \mathrm{~L}_{2} \Rightarrow \mathrm{~L}_{1} \leq \mathrm{L}_{2}$

Thus ' $\leq$ ' is reflexive.
Suppose $\mathrm{L}_{1} \leq \mathrm{L}_{2}$ and $\mathrm{L}_{2} \leq \mathrm{L}_{1}$
$\Rightarrow \mathrm{L}_{1} \subseteq \mathrm{~L}_{2}$ and $\mathrm{L}_{2} \subseteq \mathrm{~L}_{1}$
Now by the definition of equality in languages
Since $\mathrm{L}_{1} \subseteq \mathrm{~L}_{2}$ and $\mathrm{L}_{2} \subseteq \mathrm{~L}_{1}$ imply $\mathrm{L}_{1}=\mathrm{L}_{2}$
Thus ' $\leq$ ' is antisymmetric.
Suppose $\mathrm{L}_{1} \leq \mathrm{L}_{2}$ and $\mathrm{L}_{2} \leq \mathrm{L}_{3} \Rightarrow \mathrm{~L}_{1} \subseteq \mathrm{~L}_{2}$ and $\mathrm{L}_{2} \subseteq \mathrm{~L}_{3}$
Now $\mathrm{L}_{1} \subseteq \mathrm{~L}_{2} \subseteq \mathrm{~L}_{3} \Rightarrow \mathrm{~L}_{1} \subseteq \mathrm{~L}_{3}$
$\Rightarrow \mathrm{L}_{1} \leq \mathrm{L}_{3}$
Thus ' $\leq$ ' is transitive.
Therefore ( $\mathbf{L}, \leq$ ) is a partially ordered language.
Theorem: Let $\mathbf{L}$ be the class of regular languages. Then the poset $\mathbf{L}$ is a lattice in which $\mathrm{L}_{1} \vee \mathrm{~L}_{2}=\mathrm{L}_{1} \cup \mathrm{~L}_{2}$ and $\mathrm{L}_{1} \wedge$ $\mathrm{L}_{2}=\mathrm{L}_{1} \cap \mathrm{~L}_{2}$.
Proof: Now we show that $\mathbf{L}$ is a lattice .
Claim 1: 1. u. b. $\left\{\mathrm{L}_{1}, \mathrm{~L}_{2}\right\}=\mathrm{L}_{1} \vee \mathrm{~L}_{2}=\mathrm{L}_{1} \cup \mathrm{~L}_{2}$
Let $L=L_{1} \cup L_{2}$
By definition of union on languages
$\mathrm{L}_{1} \subseteq \mathrm{~L}$ and $\mathrm{L}_{2} \subseteq \mathrm{~L}$
$\Rightarrow \mathrm{L}_{1} \leq \mathrm{L}$ and $\mathrm{L}_{2} \leq \mathrm{L}$
Suppose there exists $\mathrm{L}_{*}$ such that $\mathrm{L}_{1} \leq \mathrm{L}_{*}$ and $\mathrm{L}_{2} \leq \mathrm{L}_{*}$
$\Rightarrow \mathrm{L}_{1} \subseteq \mathrm{~L}_{*}$ and $\mathrm{L}_{2} \subseteq \mathrm{~L}_{*}$
$\Rightarrow \mathrm{L}_{1} \cup \mathrm{~L}_{*}=\mathrm{L}_{*}$ and $\mathrm{L}_{2} \cup \mathrm{~L}_{*}=\mathrm{L}_{*}$
Consider $\mathrm{L}_{*}=\mathrm{L}_{1} \cup \mathrm{~L}_{*}$
$=\mathrm{L}_{1} \cup\left(\mathrm{~L}_{2} \cup \mathrm{~L}_{*}\right)$
$=\left(\mathrm{L}_{1} \cup \mathrm{~L}_{2}\right) \cup \mathrm{L}_{*}$
$\Rightarrow \mathrm{L}_{1} \cup \mathrm{~L}_{2} \subseteq \mathrm{~L}_{*}$
$\Rightarrow \mathrm{L} \subseteq \mathrm{L}_{*}$
$\Rightarrow \mathrm{L} \leq \mathrm{L}^{*}$
Thus 1. u. b. $\left\{\mathrm{L}_{1}, \mathrm{~L}_{2}\right\}=\mathrm{L}_{1} \vee \mathrm{~L}_{2}=\mathrm{L}_{1} \cup \mathrm{~L}_{2}=\mathrm{L}$
Claim 2: g. 1. b. $\left\{\mathrm{L}_{1}, \mathrm{~L}_{2}\right\}=\mathrm{L}_{1} \wedge \mathrm{~L}_{2}=\mathrm{L}_{1} \cap \mathrm{~L}_{2}$
Let $L=L_{1} \cap L_{2}$
By definition of intersection on languages
$\mathrm{L} \subseteq \mathrm{L}_{1}$ and $\mathrm{L} \subseteq \mathrm{L}_{2}$
$\Rightarrow \mathrm{L} \leq \mathrm{L}_{1}$ and $\mathrm{L} \leq \mathrm{L}_{2}$
Suppose there exists $\mathrm{L}_{*}$ such that $\mathrm{L}_{*} \leq \mathrm{L}_{1}$ and $\mathrm{L}_{*} \leq \mathrm{L}_{2}$
$\Rightarrow \mathrm{L}_{*} \subseteq \mathrm{~L}_{1}$ and $\mathrm{L} * \subseteq \mathrm{~L}_{2}$
$\Rightarrow \mathrm{L}_{*}=\mathrm{L}_{*} \cap \mathrm{~L}_{1}$ and $\mathrm{L}_{*}=\mathrm{L}_{*} \cup \mathrm{~L}_{2}$
Consider $\mathrm{L}_{*}=\mathrm{L} * \cap \mathrm{~L}_{2}$
$=\left(\mathrm{L}_{*} \cap \mathrm{~L}_{1}\right) \cap \mathrm{L}_{2}$
$=\mathrm{L} * \cap\left(\mathrm{~L}_{1} \cap \mathrm{~L}_{2}\right)$
$\Rightarrow \mathrm{L}_{*} \subseteq \mathrm{~L}_{1} \cap \mathrm{~L}_{2}$
$\Rightarrow \mathrm{L}_{*} \subseteq \mathrm{~L} \Rightarrow \mathrm{~L} * \leq \mathrm{L}$
Thus g. l. b. $\left\{\mathrm{L}_{1}, \mathrm{~L}_{2}\right\}=\mathrm{L}_{1} \wedge \mathrm{~L}_{2}=\mathrm{L}_{1} \cap \mathrm{~L}_{2}=\mathrm{L}$
Hence $\ell$ is a lattice in which $L_{1} \vee L_{2}=L_{1} \cup L_{2}$ and $L_{1} \wedge L_{2}$ $=\mathrm{L}_{1} \cap \mathrm{~L}_{2}$.

Note: For $\mathbf{L}$, the class of regular languages over a fixed $\Sigma, \varnothing € \mathbf{L}$ is the minimal element of $\mathbf{L}$ as $\varnothing \leq \mathbf{L}$ i.e. $\emptyset \subseteq \mathbf{L}$

for all $L \in \mathbf{L}$ and $\Sigma^{*} € \mathbf{L}$ is the maximal element of $\mathbf{L}$ as $L \leq \Sigma^{*}$ for all $L \in \mathbf{L}$.

Definition: The lattice $\mathbf{L}$ of regular languages is said to be a lattice monoid if it satisfies the following conditions.
(i) $\mathrm{L} * \phi=\phi * \mathrm{~L}=\phi \forall \mathrm{L} \in \mathbf{L}$.
(ii) $\mathrm{L}_{1} *\left(\mathrm{~L}_{2} \vee \mathrm{~L}_{3}\right)=\left(\mathrm{L}_{1} * \mathrm{~L}_{2}\right) \vee\left(\mathrm{L}_{1} * \mathrm{~L}_{3}\right)$ and
(iii). $\left(\mathrm{L}_{2} \vee \mathrm{~L}_{3}\right) * \mathrm{~L}_{1}=\left(\mathrm{L}_{2} * \mathrm{~L}_{1}\right) \vee\left(\mathrm{L}_{3} * \mathrm{~L}_{1}\right)$
$\forall \mathrm{L}_{1}, \mathrm{~L}_{2}, \mathrm{~L}_{3} \in \mathbf{L}$
and $*$ is a binary operation
(in particular on $\mathbf{L}, *$ is concatenation).
Note : $\Sigma^{*}$ is a free monoid generated by $\Sigma$ with the concatenation operation.

Definition: A Lattice Ordered Finite Automaton (LA) is a quintuple $\mathrm{M}=(\mathrm{Q}, \Sigma, \delta, \mathrm{I}, \mathrm{F})$ where
Q is a non-empty finite set called the set of states of M .
$\Sigma$ is a finite set called the input alphabet of $M$.
$\delta: \mathrm{Q} \times \sum \times \mathrm{Q} \rightarrow\left[\phi, \Sigma^{*}\right]$ is a function called the fuzzy transition function of $M$.
$\mathrm{I}: \mathrm{Q} \rightarrow\left[\phi, \Sigma^{*}\right]$ is a fuzzy subset of Q called the fuzzy initial state set of M.
$\mathrm{F}: \mathrm{Q} \rightarrow\left[\phi, \Sigma^{*}\right]$ is a fuzzy subset of Q called the fuzzy final state set of M.

Definition : Extend $\delta$ to $\delta^{*}$ from $\mathrm{Q} \times \Sigma \times \mathrm{Q} \rightarrow\left[\phi, \Sigma^{*}\right]$, defined as
$1 . \delta^{*}(\mathrm{q}, \varepsilon, \mathrm{p}) \quad=\sum^{*}$ if $\mathrm{q}=\mathrm{p}$
$=\phi$ otherwise
$2 . \delta^{*}(\mathrm{q}, \mathrm{sa}, \mathrm{p})=\vee\left[\delta^{*}(\mathrm{q}, \mathrm{s}, \mathrm{r}) \wedge \delta^{*}(\mathrm{r}, \mathrm{a}, \mathrm{p})\right], \mathrm{s} \in \Sigma^{*}, \mathrm{a} \in \Sigma$, $\mathrm{p}, \mathrm{q}, \mathrm{r} \in \mathrm{Q}$.

Note: For any two strings $\mathrm{s}, \mathrm{w} \in \sum^{*}$ and for all $\mathrm{p}, \mathrm{q} \in \mathrm{Q}$, $\delta^{*}(\mathrm{q}, \mathrm{sw}, \mathrm{p})=\vee\left[\delta^{*}(\mathrm{q}, \mathrm{s}, \mathrm{r}) \wedge \delta^{*}(\mathrm{r}, \mathrm{a}, \mathrm{p})\right], \mathrm{r} \in \mathrm{Q}$.

Definition: The language accepted by a lattice ordered finite automaton (LA) $\quad \mathrm{M}=(\mathrm{Q}, \Sigma, \delta, \mathrm{I}, \mathrm{F})$ denoted by $L(M)$ is the set $L(M)=\left\{s / I(q) * \delta^{*}(q, s\right.$, $\mathrm{p}) * \mathrm{~F}(\mathrm{p})\}$ and is called $\quad \ell$-language.

Definition: A $\ell$-language $L$ is said to be $\ell$ - regular language if it is accepted by some lattice ordered finite automaton (LA) i.e. $\mathrm{L}=\mathrm{L}(\mathrm{M})$.

Note: Two lattice ordered finite automaton LA's $\mathrm{M}_{1}$ and $\mathrm{M}_{2}$ are said to be equivalent if they accept same $\ell$ language i.e. $\mathrm{L}\left(\mathrm{M}_{1}\right)=\mathrm{L}\left(\mathrm{M}_{2}\right)$.
